

Calculus I Math 226 Spring 2013
--

Text: *Thomas' Calculus: Early Transcendentals*, Twelfth edition

Prerequisites – all three are necessary:

- Satisfactory completion of ELM requirement, i. e., 'ELM exempt' or ELM score 50 or better;
- One of the following: MATH 109 or equivalent with a grade of C or better better (Math 110 cannot be substituted for Math 109); or passing a high school calculus class or trigonometry-based class with a grade of B or better;
- Acceptable score on the *Calculus readiness test*.

Instructor: Joseph Gubeladze
Office: Thortnon Hall 932
Phone: (415) 338 7722
e-mail: soso@sfsu.edu
Office Hours: Mondays, 1–2pm, Thursdays 1–2pm.

TA: Christopher Nagel
e-mail: cnagel@mail.sfsu.edu
Office: TBA
Office hours: TBA

Section: 226[03]
Room BUS 219
Lectures: MWF 10:10–11am
Recitation: Tue 10–10:50am

Bulletin Description.The first semester of Calculus: limits, continuity, derivatives, rules of differentiation, applications of differentiation, optimization, L'Hpital's Rule, curve sketching, integration, the Fundamental Theorem of Calculus.

Course Objectives.MATH 226 is the first semester of calculus for science, engineering, and mathematics majors. This is not a business calculus course. Students entering Calculus I should have a firm grasp of algebra and trigonometry. They should be able to graph elementary algebraic and transcendental functions and their inverses. Students should also be able to solve inequalities and equations involving exponential, logarithmic and trigonometric functions. The main objective of Calculus I is for students to learn the basics of the calculus of functions of one variable. They will study transcendental functions, limits, differentiation and an introduction

to the Riemann integral, culminating with the Fundamental Theorem of Calculus. They will also apply these ideas to a wide range of problems that include the equations of motion, related rates, curve sketching and optimization. The students should be able to interpret the concepts of Calculus algebraically, graphically and verbally. More generally, the students will improve their ability to think critically, to analyze a problem and solve it using a wide array of tools. These skills will be invaluable to them in whatever path they choose to follow, be it as a mathematics major or in pursuit of a career in one of the other sciences. Upon successful completion of the course, students should be able to:

- Evaluate a variety of limits, including limits at infinity, one-sided limits, and limits of indeterminate forms. Students should also be able to identify discontinuities in functions presented algebraically or graphically
- Apply the definition of derivative to calculate and estimate derivatives from formulas, graphs, or data
- Differentiate sums, products and quotients of composite polynomial, trigonometric, exponential, and logarithmic functions.
- Discuss the conceptual relations among derivatives, rates of change, and tangent lines in the context of an applied example.
- Use asymptotes, first and second derivatives to graph functions.
- Solve applied problems using calculus and justify answers.
- Estimate a definite integral with a Riemann sum.
- Evaluate a simple definite integral using the Fundamental Theorem of Calculus.
